AWC Aviation Weather Testbed (AWT)

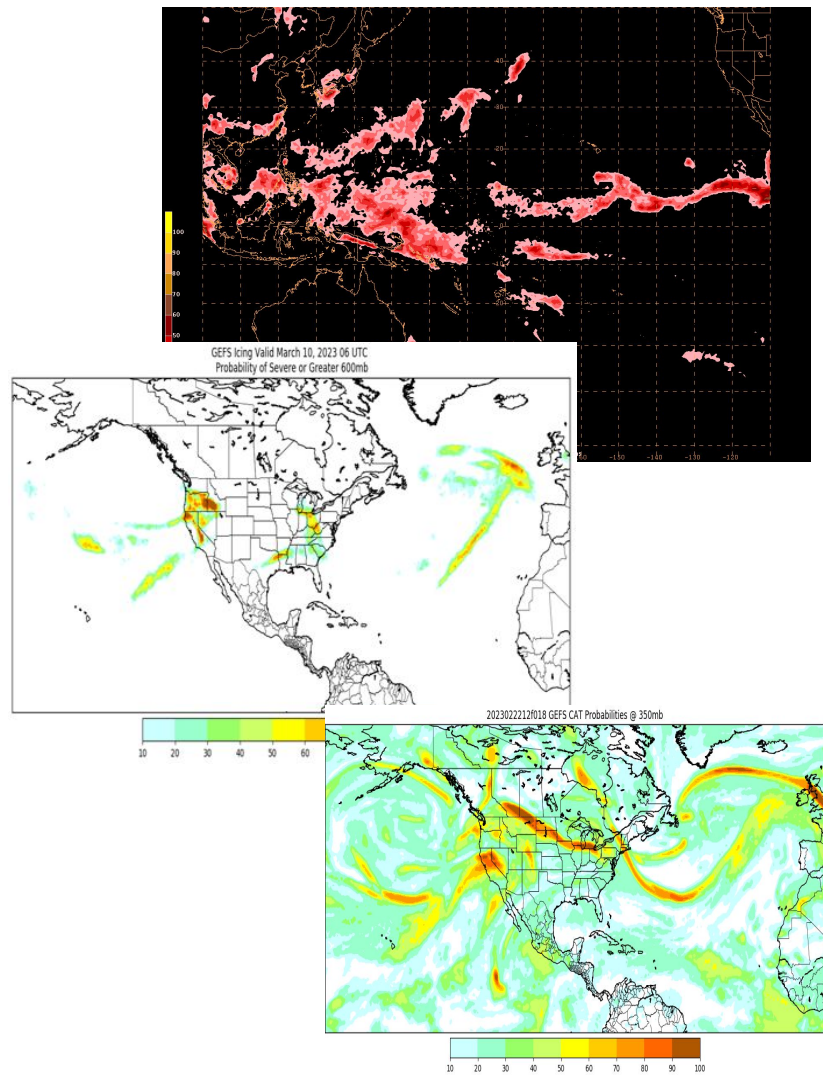

Aviation Impacts for Denver (KDEN) 12Z Thurs - 00Z Fri

Global Ensembles

- International Civil Aviation Organization (ICAO) requirement for World Area Forecast Centers (WAFCs; Washington and London) to produce global probabilistic guidance for in-flight icing, turbulence, and convection by 2027
- Ensemble Prediction of Oceanic Convective Hazards (EPOCH) operational on WCOSS2 June 2023
 - Calibrated probabilities, driven by GEFS/GEPS
- GEFS driven probabilistic icing and turbulence in development
- Eventually blend WAFC Washington and WAFC London probabilistic guidance to create consistent World Area Forecast System (WAFS) probabilistic guidance
- For more detail:
 - Alex Korner poster - ***Global, Probabilistic Guidance for Convection, Turbulence, and In-Flight Icing***

Winter Weather Dashboard

- Decision support for FAA air traffic managers and operational meteorologists to coordinate long range strategic winter weather planning
- Convey impacts due to potential snowfall accumulation, freezing rain accumulation, or visibility restrictions
- Current operational version driven by SREF input
- New version utilizing GEFS input in development as part of AviationWeather.gov upgrade

- SREF individual member GEMPAK grids used as input to current operational dashboard
 - Provide explicit snow and freezing rain accumulations
- GEFSv12 individual member output does not include explicit winter precip accumulations
- Requires complex algorithms to produce accumulations of snow and freezing rain for new GEFS dashboard
 - Total precip
 - Percent frozen precip
 - Categorical precip types
 - Not ideal!
- Big thumbs up from AWC on explicit winter precip accumulations in GEFSv13

Regional Ensemble Aviation Hazard Needs

Icing & Turbulence

- Forecast Icing Potential (FIP) and Graphical Turbulence Guidance (GTG) products currently post process solely from deterministic regional models (RAP)
- Projects underway to merge FIP and GTG into UPP for RRFs
- Opportunity to produce regional ensemble guidance for icing and turbulence in RRFs ensemble?
 - Resource challenges

Ceiling & Visibility

- AWC C&V forecasters generally prefer guidance from the Localized Aviation MOS Program (LAMP) over that of HREF
 - HREF members not originally developed with C&V in mind
 - HREF probabilistic thresholds don't align with flight category thresholds

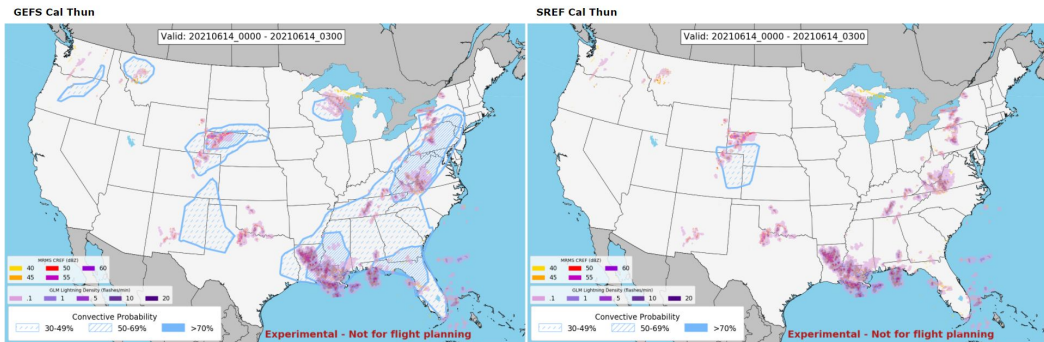

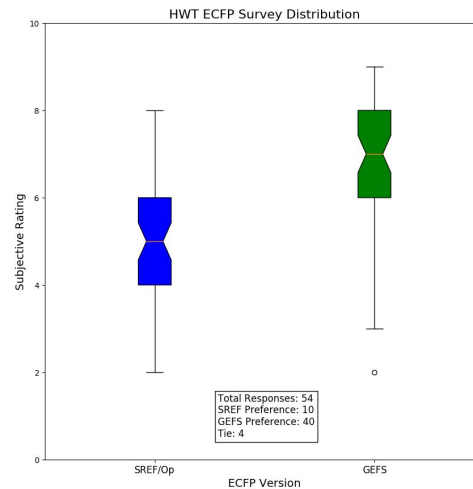

HREF Probabilistic Thresholds	Ceiling	Visibility
	< 1000 ft	< 1/4 mi
	< 2000 ft	< 1/2 mi
	< 3000 ft	< 1 mi
	< 4500 ft	< 2 mi
	< 6000 ft	< 4 mi

Category	Color	Ceiling	Visibility
LIFR Low Instrument Flight Rules	Magenta	below 500 feet AGL	and/or less than 1 mile
IFR Instrument Flight Rules	Red	500 to below 1,000 feet AGL	and/or 1 mile to less than 3 miles
MVFR Marginal Visual Flight Rules	Blue	1,000 to 3,000 feet AGL	and/or 3 to 5 miles
VFR Visual Flight Rules	Green	greater than 3,000 feet AGL	and greater than 5 miles

Extended Convective Forecast Product (ECFP)

- Highlight high confidence (>30%) areas of convective probability for extended range traffic flow management planning
- Operational ECFP driven by SPC SREF calibrated thunder probabilities
- 2021 AWT/HWT collaboration to test prototype GEFS calibrated thunder based ECFP
- SREF calibrated thunder very diurnally driven
- GEFS a significant improvement

EXPERIMENTAL — NOT FOR FLIGHT PLANNING

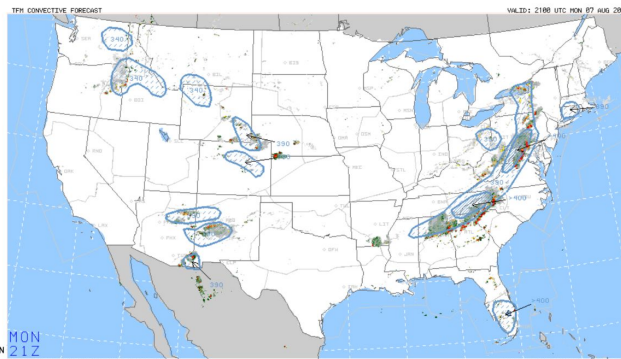

Traffic Flow Management (TFM) Convective Forecast (TCF)

- High confidence graphical representation of forecasted convection
- Produced every 2 hours with at 4-, 6-, and 8-hr forecast lead times, depicting areas of sparse (25%), medium (40%), or solid line (75%) convective coverage for specific echo top heights
- Forecaster produced March-October, automated November-February
- Authoritative source of convective weather forecast information for Traffic Flow Management strategic planning for FAA and airlines

 - ZME/ZFW Sparse (S AR)
 - ZDV Medium (NE/KS)
 - ZAB Medium (TX/NM)

Traffic Flow Management (TFM) Convective Forecast (TCF)

- AWC TCF forecasters heavily utilize HREF ensemble guidance in forecast creation
 - Particularly SPC calibrated thunder probabilities
- Forecasters (both AWC and CWSU) well tuned to behavior of individual HREF members
- RRFs single core ensemble a large paradigm shift for operations
 - Feedback from AWT experiments involving RRFs includes large amount of uncertainty from operational participants
 - Socialization is key!

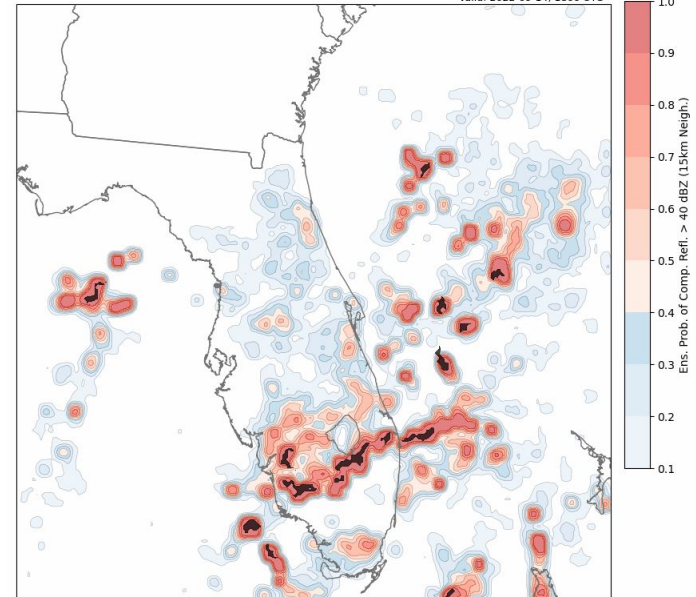

AWT Summer Experiment 2022 - WoFS

- First testbed evaluation of Warn on Forecast System focused on aviation
- WoFS has potential to add significant value to aviation convective TFM
 - Shorter TCF lead times (4-6 hrs)
 - AWC/CWSU IDSS
- Additional WoFS domains would greatly increase utility for aviation
- Increase “agility” of TFM process to utilize rapidly updating probabilistic guidance

Ens. Prob. of Comp. Refl. > 40 dBZ (15km Neigh.)

AWC Ensemble Takeaways/Recommendations

- *High resolution ensembles*
 - Continued collaborative feedback process with NOAA Testbeds
 - Assess timing for beginning socialization in operations
 - Scope feasibility of regional scale probabilistic guidance for in-flight icing and turbulence
- *Continued development of post processed probabilistic calibrated guidance products*
- *Jack Lind - Evaluating User-Understanding of Probabilistic Information at the 2023 AWT Experiment (Wednesday, Session 6b)*
