# WRF-Hydro Modeling System: Physics Components

D. Gochis, W. Yu, D. Yates, K. Sampson, A. Dugger, J. McCreight, M. Barlage, A. RafieeiNasab, L. Karsten, L. Read, L. Pan, Y. Zhang, M. McAllister, J. Mills, K. FitzGerald, R. Cabell

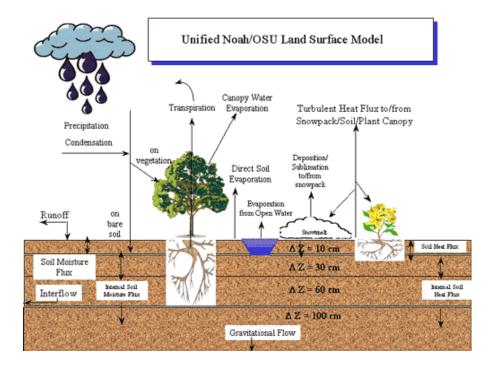

National Center for Atmospheric Research

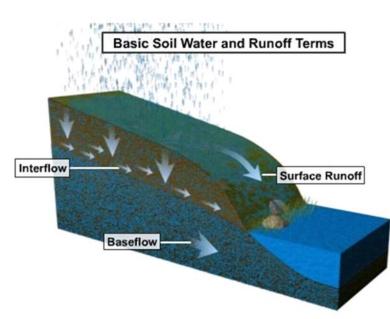

#### Outline:

- Basic Concepts
- Conceptualization of WRF-Hydro
- Model Architecture & Requirements

#### **Basic Concepts:**

 Linking the column structure of land surface models with the 'distributed' structure of hydrological models in a flexible, HPC architecture....

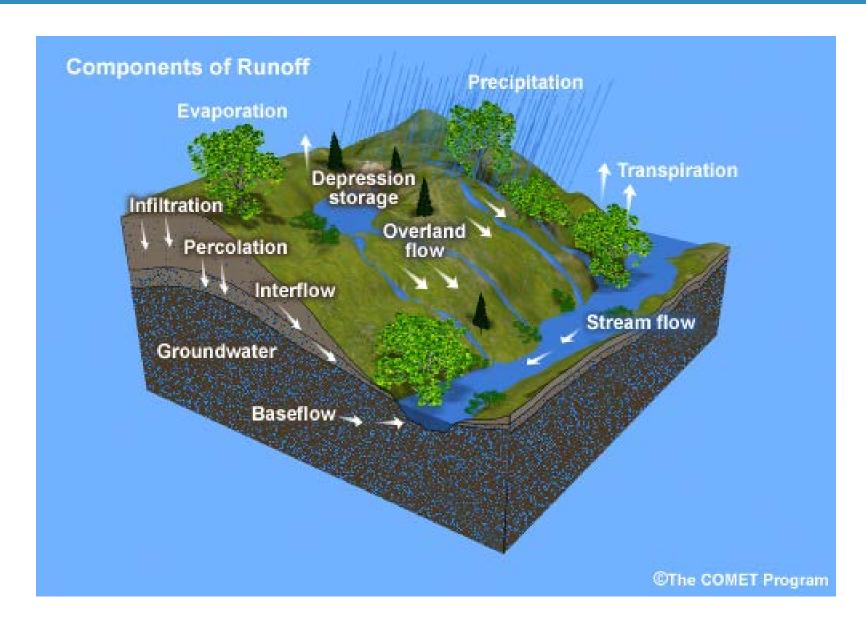

## Conceptualization of WRF-Hydro

 Atmospheric coupling perspective and serving the WRF research and forecasting and CESM communities

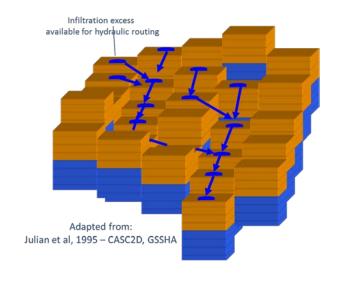

- Oriented towards existing NCAR-supported community models, but expanding:
  - Not fully genericized coupling which has pros/cons associated...
  - Also aimed at cluster & HPC architectures

Goal...

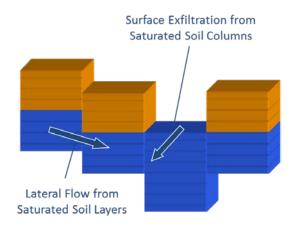

#### Runoff and Routing Physics:

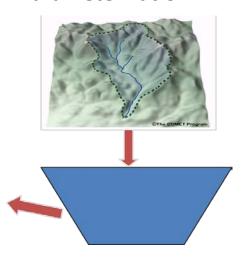

#### **Overland Flow**

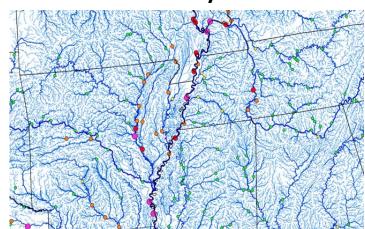

#### **Lateral Subsurface Flow**

## Simplified Baseflow Parameterization

**Channel Hydraulics** 

**Simple Water Management** 

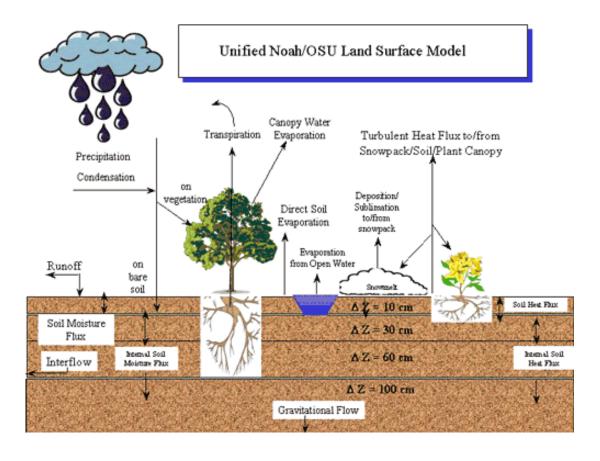

## WRF-Hydro Physics Permutations

		WRF-Hydro Options C	Surrent NWM Configuration
Column Land Surface Model	and the property of the proper	3 up-to-date column land models: Noah, NoahMP (w/ built-in multi-physics options), Sac-HTET	NoahMP
Overland Flow Module	in Sharaton accommendation for the polyade resident for the polyade resident for polyade resident for the polyade form.  Adapted Form.  Julian et al., 1979 – CACCIO, CSSHA	3 surface routing schemes: diffusive wave, kinematic wave, direct basin aggregation	Diffusive wave
Lateral Subsurface Flow Module	Surface Exfitration from Saturated Soll Columns  Lateral Flow from Saturated Soil Levers	2 subsurface routing scheme: Boussinesq shallow saturated flow, 2d aquifer model	Boussinesq shallow saturated flow
Conceptual Baseflow Parameterizations		2 groundwater schemes: direct aggregation storage-release: pass-throug or exponential model	h Exponential model
Channel Routing/ Hydraulics	$\begin{array}{c c} \Delta x & Q \\ \hline & Q \\ \hline & h \\ \hline & T_b \\ \end{array}$	5 channel flow schemes: diffusive wave, kinematic wave, RAPID, custom-network Muskingum or Muskingum-Cunge	
Lake/Reservoir =	$ \longrightarrow \text{Inflow}  h_{max} $	1 lake routing scheme: level- pool management	Level-pool management

#### **Current Land Surface Models:**

Column physics & land-atmosphere exchange

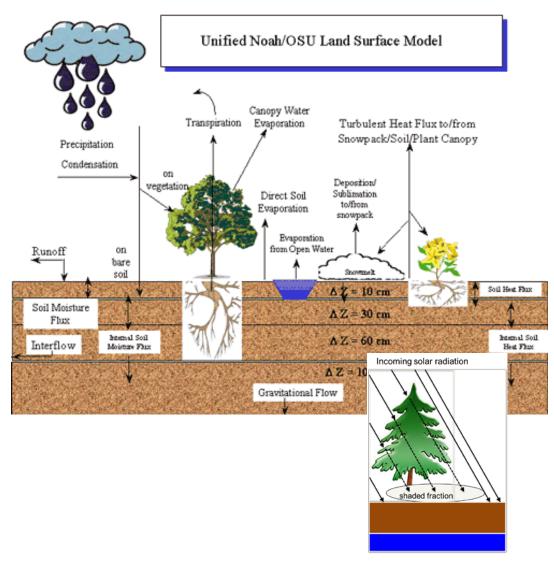

#### NoahMP Column Physics:

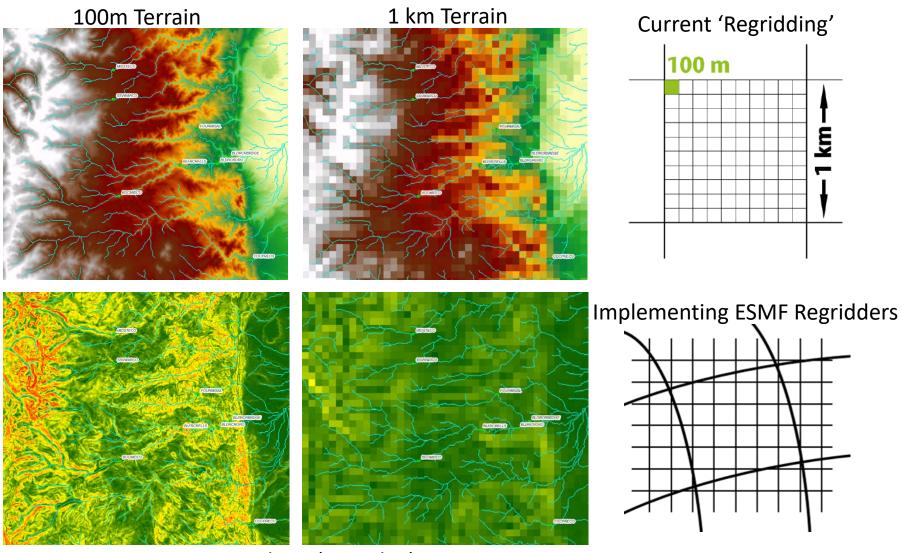

Noah-MP contains several options for land surface processes:

- 1. Dynamic vegetation/vegetation coverage (4 options)
- 2. Canopy stomatal resistance (2 options)
- 3. Canopy radiation geometry (3 options)
- 4. Soil moisture factor for stomatal resistance (3 options)
- 5. Runoff and groundwater (4 options)
- 6. Surface layer exchange coefficients (4 options)
- 7. Supercooled soil liquid water/ice fraction (2 options)
- 8. Frozen soil permeability options (2 options)
- 9. Snow surface albedo (2 options)
- 10. Rain/snow partitioning (3 options)
- 11. Lower soil boundary condition (2 options)
- 12. Snow/soil diffusion solution (2 options)

Total of ~50,000 permutations can be used as multiphysics ensemble members

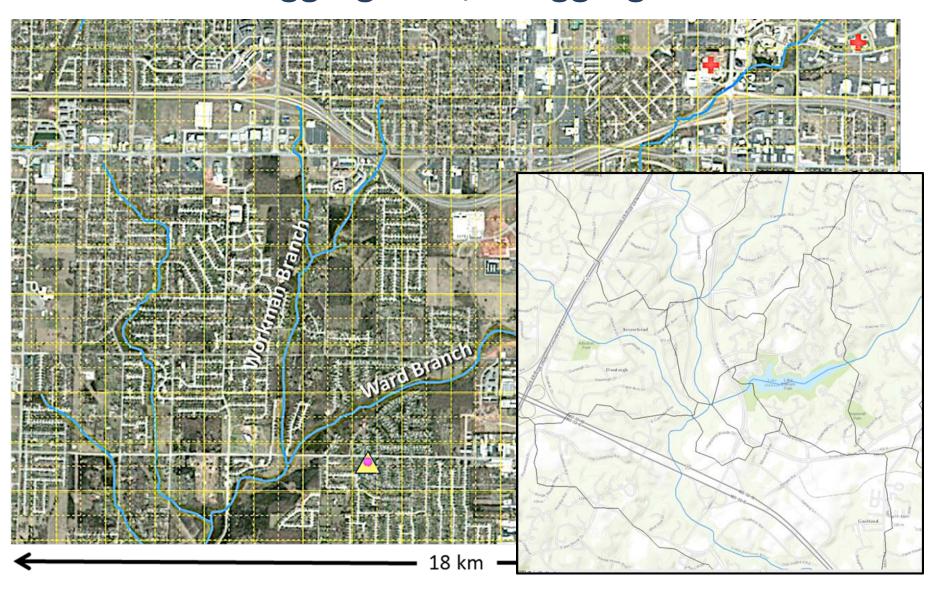

Multi-scale aggregation/disaggregation:

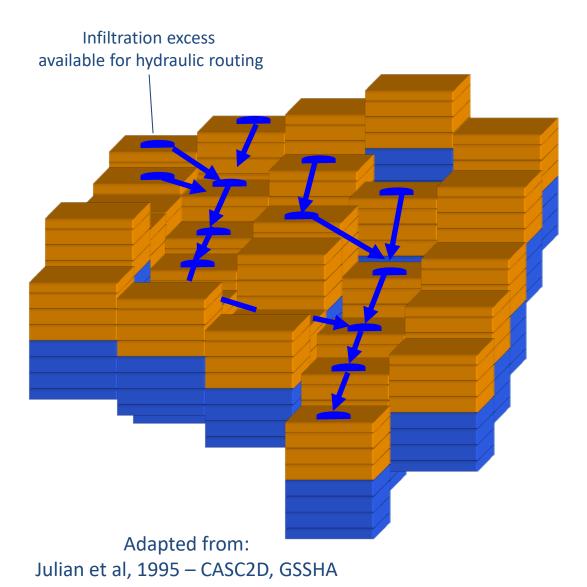

Terrain slope (0-45 deg)

Multi-scale aggregation/disaggregation:

# Terrain Routing

## **Surface Routing**

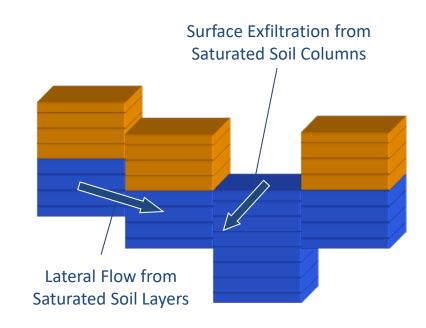

- Pixel-to-pixel routing
  - Steepest descent or 2d
  - Diffusive wave/backwater permitting
  - Explicit solution
- Ponded water (surface head) is fullyinteractive with land model
- Sub-grid variability of ponded water on routing grid is preserved between land model calls

#### Surface Routing: Key Settings and Parameters

Parameter/Setting	Description	Scale/File	Estimate	
Runtime Settings				
OVRTSWCRT	Overland routing physics switch (on/off)	hydro.namelist	Landscape/event, compute resources (computationally intensive)	
DTRT_TER	Overland routing timestep	hydro.namelist	Based on grid size, landscape/event	
Parameters				
TOPOGRAPHY	Land surface elevation; routing based on elevation+head gradient	Routing grid (Fulldom)	Various sources	
OV_ROUGH2D	Overland roughness (Manning's n for land)	LSM grid (hydro2dtbl)	Estimated based on land cover type	
OVROUGHRTFAC	Multiplier on overland roughness	Routing grid (Fulldom)	Calibrated	
RETDEPRTFAC	Multiplier on maximum retention depth on surface before overland flow processes are initiated	Routing grid (Fulldom)	Calibrated (internally scaled based on topographic slope)	

#### Subsurface Routing in v5

Adapted from: Wigmosta et. al, 1994

- Quasi steady-state, Boussinesq saturated flow model
- Exfiltration from fully-saturated soil columns
- Anisotropy in vertical and horizontal Ksat
- No 'perched' flow
- Soil depth is uniform
- Critical initialization value: water table depth

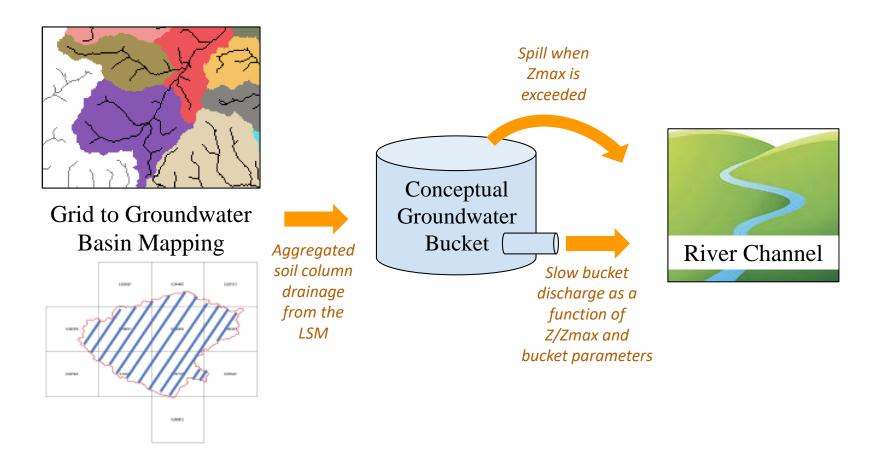

#### Subsurface Routing: Key Settings and Parameters

Parameter/Setting	Description	Scale/File	Estimate
Runtime Settings			
SUBRTSWCRT	Subsurface routing physics switch (on/off)	hydro.namelist	Landscape/event
NOAH_TIMESTEP	LSM timestep	namelist.hrldas	Landscape/event
Parameters			
TOPOGRAPHY	Land surface elevation; routing based on elevation+head gradient	Routing grid (Fulldom)	Various sources
LKSAT	Lateral saturated hydraulic conductivity	LSM grid (hydro2dtbl)	Estimated based on soil texture class
LKSATFAC	Multiplier on lateral conductivity	Routing grid (Fulldom)	Calibrated
SMCMAX1	Soil porosity	LSM grid (hydro2dtbl)	Estimated based on soil texture class; calibrated
SMCREF1	Soil field capacity	LSM grid (hydro2dtbl)	Estimated based on soil texture class; calibrated

#### Runoff and Routing Physics: Deep Groundwater

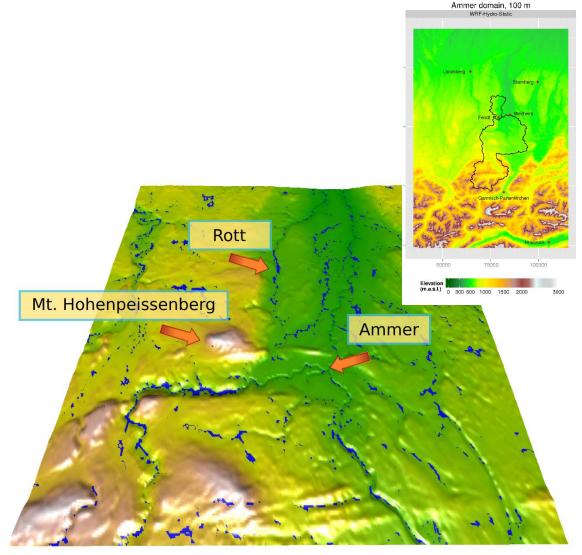

#### Conceptual groundwater baseflow "bucket" model:

- Simple pass-through or 2-parameter exponential model
- Bucket discharge gets distributed to channel network

#### Subsurface Routing in v5

- 2d groundwater model
- Coupled to bottom of LSM soil column through Darcy-flux parameterization
- Independent hydraulic characteristics vs. soil column
- Full coupling to gridded channel model through assumed channel depth and channel head
- Detailed representation of wetlands

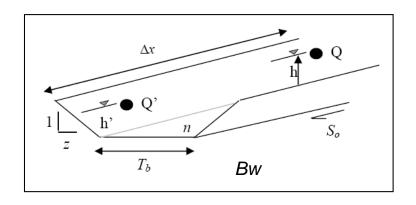

Surface ponded water from coupled groundwater in WRF-Hydro B. Fersch, KIT, Germany

#### Deep Groundwater: Key Settings and Parameters

Parameter/Setting	Description	Scale/File	Estimate
Runtime Settings			
GWBASESWCRT	Baseflow bucket model switch (pass-through, exp, off)	hydro.namelist	Landscape/event
NOAH_TIMESTEP	LSM timestep	namelist.hrldas	Landscape/event
Parameters			
GWBASINS/spatialweights	Groundwater "basins"	LSM (GWBASINS) or routing grid (spatialweights)	Landscape
slope	"Openness" of bottom soil column boundary	LSM grid (soil_properties)	Calibrated
Coeff	Coefficient in exponential bucket equation	Bucket objects (GWBUCKPARM)	Calibrated
Expon	Exponent in exponential bucket equation	Bucket objects (GWBUCKPARM)	Estimated based on soil texture class; calibrated
Zmax	Maximum bucket depth	Bucket objects (GWBUCKPARM)	Estimated based on soil texture class; calibrated

# **Channel Routing**

#### Channel routing: Gridded vs. Reach-based

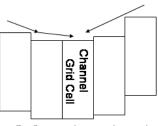

#### Solution Methods:

- Gridded: 1-d diffusive wave: fully-unsteady, explicit, finite-difference
- Reach: Muskingum, Muskingum-Cunge (much faster)

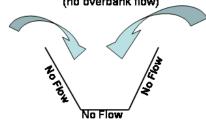

#### Parameters:

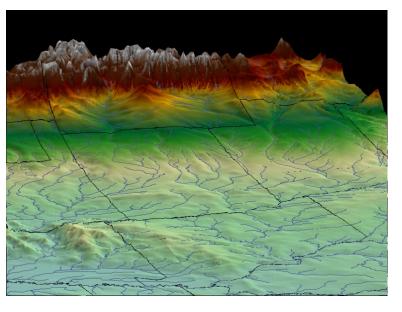

- A priori function of Strahler order
- Trapezoidal channel (bottom width, side slope)

 Surface water on channel grid cells get deposited in channel as 'lateral inflow'

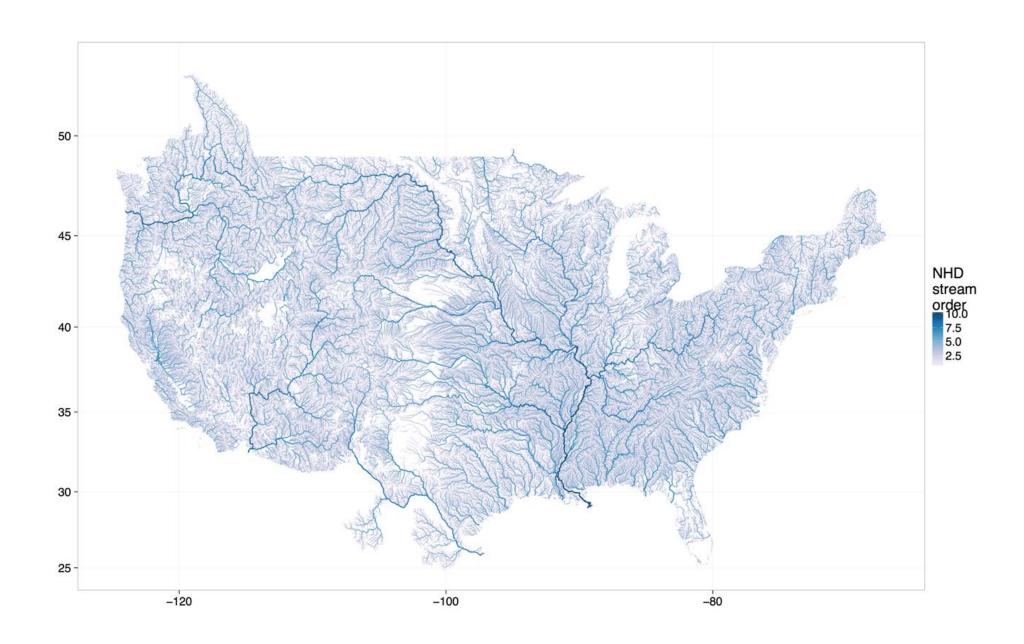

- One-way ov. flow into channel
- No sub-surface losses
- 'Infinite' channel depth (no overbank flow)

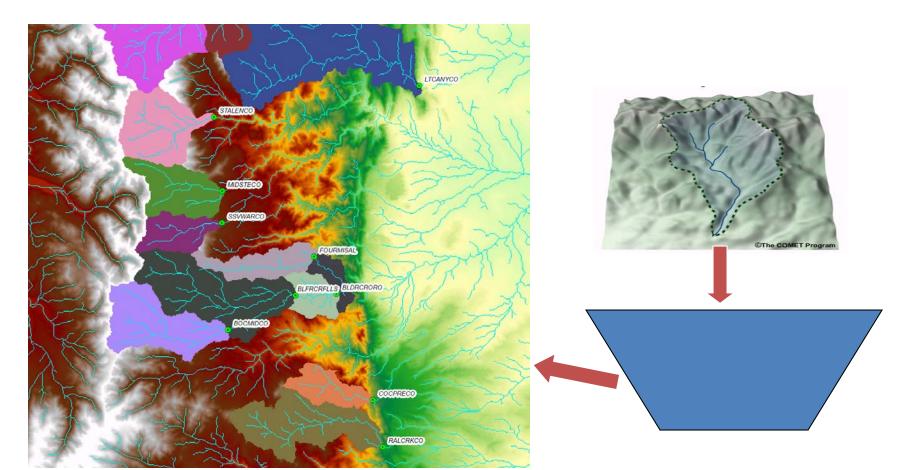

#### NHDPlus Reach Channel Network

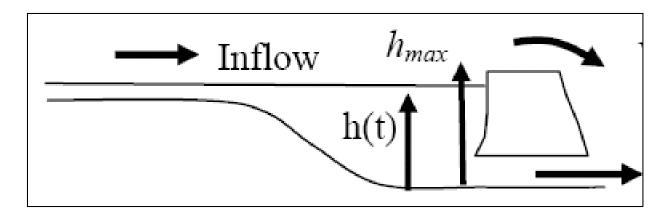

#### Optional conceptual 'Bucket' models:

- Used for continuous (vs. event) prediction
- Simple pass-through or 2-parameter exponential model
- Bucket discharge gets distributed to channel network

#### Optional lake/reservoir model:

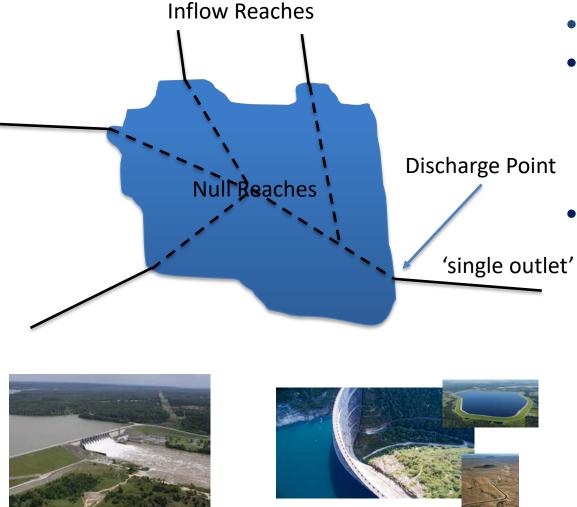

- Level-pool routing (i.e. no lagging of wave or gradient in pool elevation)
- Inflows via channel and overland flow
- Discharge via orifice and spillway to channel network
- Parameters: lake and orifice elevations, max. pool elevation, spillway and orifice characteristics; specified via parameter table
- Active management can be added via an operations table
- Presently no seepage or evaporative loss functions

## Lakes & Reservoirs

#### WRF-Hydro V5.0 Physics Components: Lake/Reservoir Represenation

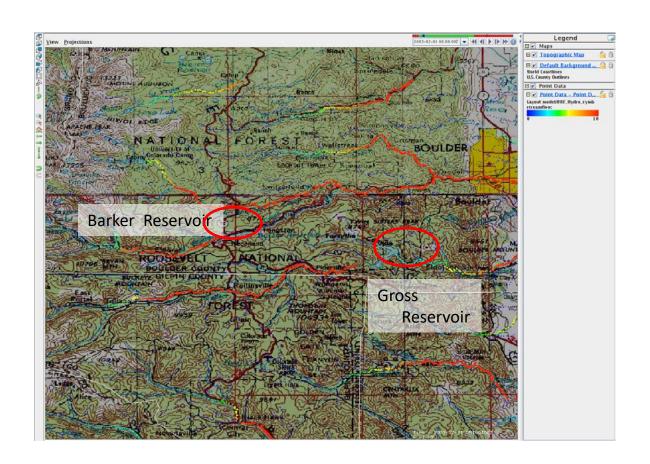

- Defined in GIS Pre-processing, integrated with channel hydrograph
- Specified spillway characteristics (length, height)

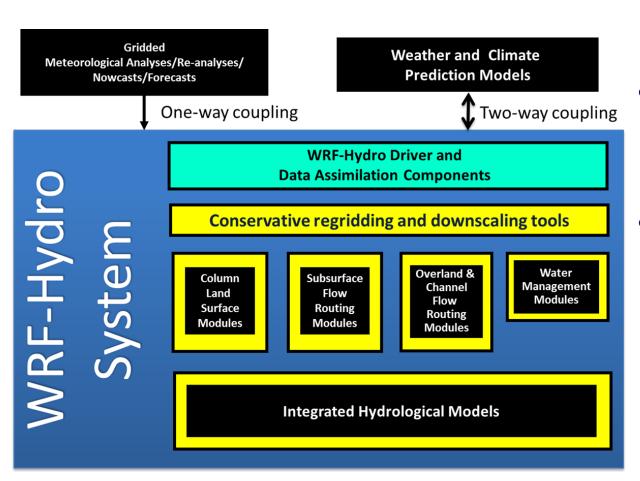

- Level Pool Scheme:
- 3 'passive' discharge mechanisms:
  - Orifice flow
  - Spillway flow
  - Direct Pass-through
  - Development:
    - Basic thermodynamics (CLM/WRF lake model)
    - Full lake accounting
      - Evaporation
      - Ice formation
      - Inflows/outflows
      - Simple management
    - Coupling to FVCOM (GLERL)

Implementing lakes and reservoirs in WRF-Hydro

Visualization of lake impacts

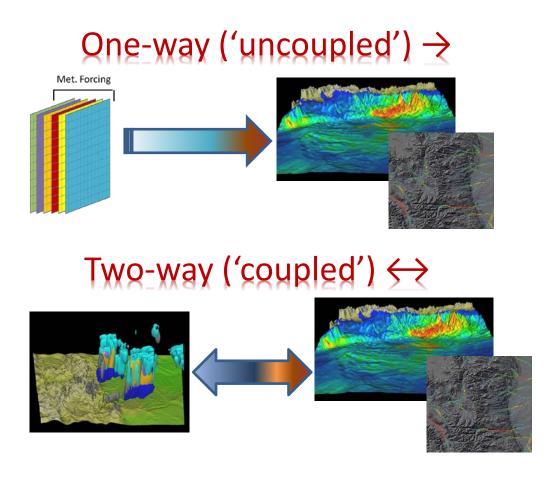

#### WRF-Hydro Model Architecture

Model physics components....

- Multi-scale components....
  - Rectilinear regridding
  - ESMF regridding
  - Downscaling

#### WRF-Hydro Model Architecture

- Modes of operation..1-way vs.2-way
- Model forcing and feedback components:
  - Forcings: T, Press,
     Precip., wind,
     radiation, humidity,
     BGC-scalars
  - Feedbacks: Sensible, latent, momentum, radiation, BGC-scalars

# **Routing Options**

Туре	When/Why To Use	Benefits	Drawbacks
Subsurface Routing			
SUBRTSWCRT	When local topography is important to flow processes or your fluxes/states of interest	Allows lateral water movement between cells, better representing convergence/divergence patterns (e.g., water converging into a valley) and residence times	More computationally expensive
Overland Flow Routing			
OVRTSWCRT	When fast surface flow processes are of interest/importance (e.g., flood forecasting vs. water supply forecasting)	Better represents local ponding and re- infiltration; required to capture land runoff directly to channels and lakes	More computationally expensive
Channel Routing			
CHANRTSWCRT	When you want streamflow in the channel		
Muskingham- <b>Reach</b> channel_option = 1	When you want an approximate solution as efficiently as possible (e.g., over a large domain or with limited compute resources)	Computationally cheap and fast	Limited to uniform fluxes/states per reach (not ideal if reaches are long); no backwater effects
Muskingham-Cunge- <b>Reach</b> channel_option = 2	When you want an approximate solution as efficiently as possible (e.g., over a large domain or with limited compute resources)	Computationally cheap and fast; more "stable" in terms of propagating flow one-way down the channel	Limited to uniform fluxes/states per reach (not ideal if reaches are long); no backwater effects
Diffusive Wave- <b>Gridded</b> channel_option = 3	When you need a more precise/accurate local solution and have sufficient compute resources (e.g., small or high-resolution domains, conditions where hydraulic processes are important)	Captures backwater flow; provides higher spatial detail on channel flow (e.g., every channel grid cell); only option that allows (limited) water fluxes from land to lake	More computationally expensive, can be sensitive to parameters and internal time steps
